## Problem Set 1 [1]

This problem set covers material from lectures 1-3 and also has some revision material concerning abelian groups.

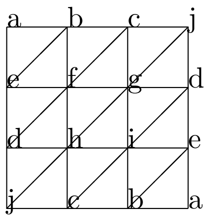
1. Recall that *free abelian group with generators* $\sigma_i, i \in I$ denoted
$$\bigoplus_i \mathbb{Z}\,\sigma_i =: F$$
consists of all formal finite linear combinations of the $\sigma_i$. If $I = \{1, \dots, r\}$ we write this as $\mathbb{Z}\,\sigma_1 \oplus \ldots \oplus \mathbb{Z}\,\sigma_r$. Show that in this case $F \simeq \mathbb{Z}^r$.

2. Given an abelian group $A$ and $a_1, \dots, a_s \in A$. We denote the *subgroup generated by* $a_1, \dots, a_s$ by $\mathbb{Z}\,a_1 + \ldots + \mathbb{Z}\,a_s$. Let $A = \mathbb{Z}\,\sigma_1 \oplus \ldots \oplus \mathbb{Z}\,\sigma_r$ and $B = \mathbb{Z}(\sigma_1 - \sigma_2) + \ldots + \mathbb{Z}(\sigma_{r-1} - \sigma_r)$. Show that $B \cap \mathbb{Z}\,\sigma_1 = 0$ and that $B = \sum_{i,j=1}^{r} \mathbb{Z}(\sigma_i - \sigma_j)$.

3. Show that the span of $a_0, \dots, a_n$ is their convex hull.

4. Find a labelled surface diagram for the Klein bottle.

5. Is the following a labelled surface diagram for the real projective plane?



6. Find a triangulation of the letter A.

7. Find a triangulation of the figure 8.

8. Prove that any compact subset of a Hausdorff space is closed.

9. Prove that any bijective continuous map $f\colon X \longrightarrow Y$ from a compact space $X$ to a Hausdorff space $Y$ is a homeomorphism.
